You work at a shoe factory, and you're working on creating boxes with pairs of shoes. Currently in front of you, imagine there are 3 pairs of shoes (for a total of 6 individual shoes) with the following sizes: 2 size 4s, 2 size 5s, 2 size 6s. The factory defines an "acceptable" pair as 2 shoes that differ in size by a maximum of 1 size — so a shoe with size 5 and a shoe with size 6 would count as an "acceptable" pair. If you close your eyes, and randomly pick 3 pairs of shoes, without replacement, what is the probability that you end up drawing 3 acceptable pairs?

The candidate asks clarifying questions

The candidate breaks down the question and starts brainstorming solutions

Our instructor analyzes the candidate's initial response to the question and points out what he did well

The candidate walks through the methodology for his solution, and solves the question correctly.

Our instructor explains the theory behind this question, and whiteboards a solution for this question. He also shows a snippet of the written detailed solution from the Quant Blueprint course, along with a Python code simulation which shows that the final answer approaches 1/3 with infinite trials. Here's a written solution from the course

The interviewer asks the second question. Say you're flipping a fair coin until you obtain the first H. If the first H occurs on the k'th flip, you're given k balls. We're going to randomly put these k balls into 3 bins, labeled 1 2 and 3. Find the probability that none of these 3 bins end up empty.

The candidate dissects the question and asks clarifying questions.

The candidate works through some examples and logically breaks the question down to answer the question effectively.

The candidate has answered the question correctly, and now summarizes his approach.

Our instructor breaks down the approach the candidate used and whiteboards the fundamental probability theory behind this question.

Interviewer asks the first question: Say you have $100 and are betting on a fair coin flip. Before you flip the coin, you make a bet B, that can be up to the amount of money you have. If you win, you win 2 times as much as your bet (and get your original bet back). But if you lose, you lose your bet. You're going to be tossing this coin 100 times. What is the optimal bet size at each flip to maximize long-run expected winnings?

The candidate starts by asking clarifying questions.

The candidate, right off the bat based on his intuition, answers the first part of the question.

An instructor highlights how the candidate quickly comes to an initial conclusion — this is a good signal in an interview.

The interviewer clarifies the candidate's response and asks "What's the optimal bet size?"

An instructor breaks down the candidate's solution, and whiteboards the theory.

The interviewer asks a follow up question: "what if instead of starting with $100, we start with $150?"

An instructor whiteboards and explains the candidates answer to "calculate the expected winnings of playing this game".

The interviewer asks a new question: You keep rolling a fair dice until you roll 3, 4, 5 — in that order consecutively on 3 rolls. What is the probability that you roll the die an odd number of times?

The candidate starts answering this question!

An instructor explains how to dissect this question, and whiteboards the intuition behind calculating the probability that odd or even wins. This question comes down to creating a system of questions, and the instructor explains how to create these equations.
